

The Sunlight Edge Orchestration, a component of Sunlight NexCenter, is the fastest and recommended way to deploy and manage Sunlight clusters at the Edge. It provides a single pane of glass to manage and monitor resources, take backups, move workloads around and to deploy clusters.

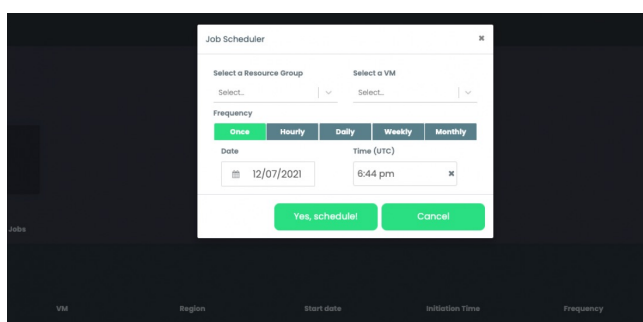

## Single pane of management for all deployments

- Full role-based access control.
- UI or API driven for easy integration.
- Monitor all resources across entire deployed estate.

## Virtual Machine management

- Ability to move VMs between Clusters.
- Use Templates to create new VMs. Ability to have private Template servers.
- Resource Groups for granular control of compute and storage.

## Data Protection

- Backup VMs on your clusters from a central location.
- Create granular snapshot schedules.
- Restore to any cluster under SIM control.
